

NAME- Harsh Pimple

PRN NO- 202501050024

BATCH- CH2

PRACTICAL NO.3

Write a Python program to create a NumPy array based on user input and display the following:

- The created NumPy array.
- The number of dimensions of the array using `ndim`
- The shape of the array using `shape`
- The total number of elements in the array using `size` Assume all input elements are valid integers.

Input Format:

- The first line contains two space-separated integers, `r` and `c`, representing the number of rows and the number of columns.
- The next lines contain space-separated integers representing the elements of the array, entered row by row.

Output Format:

- The created NumPy array (printed as a 2D array).
- An integer representing the number of dimensions of the array.
- A tuple representing the shape of the array.
- An integer representing the total number of elements in the array

CODE:

```
import numpy as np
```

```
r, c = map(int, input().split())
```

```
elements = [] for
```

```
i in range(r):
```

```
    row = list(map(int, input().split()))
```

```
    elements.extend(row)
```

```
arr = np.array(elements).reshape(r, c)
```

```
print(arr)    print(arr.ndim)
```

```
print(arr.shape) print(arr.size)
```

OUTPUT:

```
3 4
1 2 3 4
5 6 7 8
9 10 11 12
[[ 1  2  3  4]
 [ 5  6  7  8]
 [ 9 10 11 12]]
2
(3, 4)
12
=== YOUR PROGRAM HAS ENDED ===
```

Terminal Test cases

The given code takes two 3×3 matrices, `matrix_a`, and `matrix_b`, as input from the user and converts them into NumPy arrays.

Task:

You are required to compute and display the results of the following matrix operations:

1. **Addition** (`matrix_a + matrix_b`)
2. **Subtraction** (`matrix_a - matrix_b`)
3. **Element-wise Multiplication** (`matrix_a * matrix_b`)
4. **Matrix Multiplication** (`matrix_a · matrix_b`)
5. **Transpose of Matrix A**

Input Format:

- The user will input 3 rows for `matrix_a`, each containing 3 integers separated by spaces.
- Similarly, the user will input 3 rows for `matrix_b`, each containing 3 integers separated by spaces.

Output Format:

The program should display the results of the operations in the following order:

1. The result of Addition.
2. The result of Subtraction.
3. The result of Element-wise Multiplication.
4. The result of Matrix Multiplication.

CODE:

```
import numpy as np
```

```
# Input matrices
print("Enter Matrix A:")
matrix_a = np.array([list(map(int, input().split())) for i in range(3)])
```

```
print("Enter Matrix B:")
```

```
matrix_b = np.array([list(map(int, input().split())) for i in range(3)])
```

```
# Addition
```

```
addition_result = matrix_a + matrix_b
```

```
print("Addition (A + B):")
```

```
print(addition_result) # Subtraction
```

```
subtraction_result = matrix_a - matrix_b
```

```

print("Subtraction (A - B):")
print(subtraction_result) #
Multiplication (element-wise) elementwise_multiplication_result
= matrix_a * matrix_b
print("Element-wise Multiplication (A * B):")
print(elementwise_multiplication_result) # Matrix multiplication
(dot product)
matrix_multiplication_result = np.dot(matrix_a, matrix_b)
print("A dot B:") print(matrix_multiplication_result)
# Transpose transpose_a
= matrix_a.T print("Transpose
of A:") print(transpose_a)

```

OUTPUT:

```

Enter Matrix A:
1 2 3
4 5 6
7 8 9
Enter Matrix B:
1 1 1
2 2 2
3 3 3
Addition (A + B):
[[ 2  3  4]
 [ 6  7  8]
 [10 11 12]]
Subtraction (A - B):
[[ 0  1  2]
 [ 2  3  4]
 [ 4  5  6]]
Element-wise Multiplication (A * B):
[[ 1  2  3]
 [ 8 10 12]
 [21 24 27]]
A dot B:
[[14 14 14]
 [32 32 32]
 [50 50 50]]

```

```
A dot B:  
[[14 14 14]  
 [32 32 32]  
 [50 50 50]]  
Transpose of A:  
[[1 4 7]  
 [2 5 8]  
 [3 6 9]]  
=== YOUR PROGRAM HAS ENDED ===
```

You are given two arrays `arr1` and `arr2`. You need to perform horizontal and vertical stacking operations on them using NumPy.

- **Horizontal Stacking:** Stack the two matrices horizontally (side by side).
- **Vertical Stacking:** Stack the two matrices vertically (one below the other).

Input Format:

- The program should first prompt the user to input two 3x3 arrays.
- Each array consists of 3 rows, and each row contains 3 space-separated integers.
- The user will input the two arrays row by row.

Output Format:

- The program should display the result of the Horizontal Stack (sidebyside stacking) of the two arrays.
- The program should then display the result of the Vertical Stack (one below the other) of the two arrays.

CODE:

```
import numpy as np

# Input matrices
print("Enter Array1:")
arr1 = np.array([list(map(int, input().split())) for i in range(3)])

print("Enter Array2:")
arr2 = np.array([list(map(int, input().split())) for i in range(3)])

# Perform horizontal stacking (hstack)
h_stack = np.hstack((arr1, arr2))

# Perform vertical stacking (vstack)
v_stack = np.vstack((arr1, arr2))

# Output results
print("Horizontal Stack:")
print(h_stack)

print("Vertical Stack:")
print(v_stack)
```

OUTPUT:

```
Enter Array1:
1 2 3
4 5 6
7 8 9
Enter Array2:
4 5 6
7 8 9
10 11 12
Horizontal Stack:
[[ 1  2  3  4  5  6]
 [ 4  5  6  7  8  9]
 [ 7  8  9 10 11 12]]
Vertical Stack:
[[ 1  2  3]
 [ 4  5  6]
 [ 7  8  9]
 [ 4  5  6]
 [ 7  8  9]
 [10 11 12]]
=== YOUR PROGRAM HAS ENDED ===
```

Write a Python program that takes the following inputs from the user:

- Start value: The starting point of the sequence.
- Stop value: The sequence should end before this value.
- Step value: The increment between each number in the sequence.

The program should then generate a sequence using numpy based on these inputs and print the generated sequence.

Input Format:

- The user will input three integer values: start, stop, and step, each on a new line.

Output Format:

- The program should print the generated sequence based on the input values.

CODE:

```
import numpy as np
```

```
# Take user input for the start, stop, and step of the sequence
```

```
start = int(input()) stop = int(input()) step = int(input())
```

```
# Generate the sequence using np.arange()
```

```
sequence = np.arange(start, stop, step)
```

```
# Print the generated sequence
```

```
print(sequence)
```

OUTPUT:

```
3
10
2
[3 5 7 9]
==== YOUR PROGRAM HAS ENDED ====
```

You are given two arrays A and B. Your task is to complete the function `array_operations`, which will convert these lists into NumPy arrays and perform the following operations:

1. Arithmetic Operations:

- Compute the element-wise sum, difference, and product of the two arrays.

2. Statistical Operations:

- Calculate the mean, median, and standard deviation of array A.

3. Bitwise Operations:

- Perform bitwise AND, bitwise OR, and bitwise XOR on the arrays (ex: A_i OR B_i).

Input Format:

- The first line contains space-separated integers representing the elements of array A.
- The second line contains space-separated integers representing the elements of array B.

Output Format:

- For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as shown in sample test cases.

CODE:

```
import numpy as np
```

```
def array_operations(A, B):
```

```
    # Convert A and B to NumPy arrays
```

```
    A = np.array(A)
```

```
    B = np.array(B)
```

```
    # Arithmetic Operations
```

```
    sum_result = A + B        diff_result
```

```
    = A - B        prod_result = A * B
```

```
    # Statistical Operations
```

```
    mean_A = np.mean(A)  median_A =
```

```
    np.median(A)        std_dev_A =
```

```
    np.std(A)
```

```

# Bitwise Operations

and_result = A & B

or_result = A | B xor_result = A
^ B

# Output results with one space between each element print("Element-
wise Sum:", ' '.join(map(str, sum_result))) print("Element-wise Difference:", '
'.join(map(str, diff_result))) print("Element-wise Product:", ' '.join(map(str,
prod_result)))

print(f"Mean of A: {mean_A}")
print(f"Median of A: {median_A}")
print(f"Standard Deviation of A: {std_dev_A}")
print("Bitwise AND:", ' '.join(map(str, and_result)))
print("Bitwise OR:", ' '.join(map(str, or_result)))
print("Bitwise XOR:", ' '.join(map(str, xor_result)))

A = list(map(int, input().split())) # Elements of array
A B = list(map(int, input().split())) # Elements of
array B

array_operations(A, B)

```

OUTPUT:

```

1 2 3 4
5 6 7 8
Element-wise Sum: 6 8 10 12
Element-wise Difference: -4 -4 -4 -4
Element-wise Product: 5 12 21 32
Mean of A: 2.5
Median of A: 2.5
Standard Deviation of A: 1.118033988749895
Bitwise AND: 1 2 3 0
Bitwise OR: 5 6 7 12
Bitwise XOR: 4 4 4 12
=== YOUR PROGRAM HAS ENDED ===

```

The given code takes a list of integers as input and converts it into a NumPy array. Your task is to complete the code by:

- Creating a view of the `original_array` and assigning it to `view_array`.
- Creating a copy of the `original_array` and assigning it to `copy_array`.

After completing these steps, observe how modifying the view affects the `original_array`, while modifying the copy does not.

Input Format:

- A single line of space-separated integers.

Output Format:

- After modifying the view:

Original array after modifying view: <original_array>

View array: <view_array>

- After modifying the copy:

Original array after modifying copy: <original_array>

Copy array: <copy_array>

CODE:

```
import numpy as np
```

```
inputlist = list(map(int,input().split(" ")))
```

```
# Original array
```

```
original_array = np.array(inputlist)
```

```
# Create a view
```

```
view_array = original_array.view()
```

```
# Create a copy
```

```
copy_array = original_array.copy()
```

```
# Modify the view view_array[0]
```

```
= 99 print("Original array after modifying view:", original_array)
```

```
print("View
```

```
array:", view_array)
```

```
# Modify the copy copy_array[1]
```

```
= 88 print("Original array after modifying copy:", original_array)
```

```
print("Copy array:", copy_array)
```

OUTPUT:

```
10 20 30 40 50 60 70 80
Original array after modifying view: [99 20 30 40 50 60 70 80]
View array: [99 20 30 40 50 60 70 80]
Original array after modifying copy: [99 20 30 40 50 60 70 80]
Copy array: [10 88 30 40 50 60 70 80]
=== YOUR PROGRAM HAS ENDED ===
```

The given code in the editor takes a single array, array1, as space-separated integers as input from the user.

Additionally, it takes the following inputs:

- search_value: The value to search for in the array.
- count_value: The value to count its occurrences in the array.
- broadcast_value: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

- 1. Searching:** Find the indices where search_value appears in array1 and print these indices.
- 2. Counting:** Count how many times count_value appears in array1 and print the count.
- 3. Broadcasting:** Add broadcast_value to each element of array1 using broadcasting, and print the resulting array.
- 4. Sorting:** Sort array1 in ascending order and print the sorted array.

Input Format:

1. A single line containing space-separated integers representing array1.
2. An integer search_value represents the value to search for in the array.
3. An integer count_value represents the value to count in the array.
4. An integer broadcast_value represents the value to add to each element of the array.

Output Format:

1. The indices where search_value occurs in array1.
2. The count of occurrences of count_value in array1.
3. The array after adding the broadcast_value to each element.
4. The sorted array.

CODE:

```
import numpy as np

# Input array from the user array1 = np.array(list(map(int,
input().split()))))

# Searching
search_value = int(input("Value to search: ")) count_value
= int(input("Value to count: ")) broadcast_value =
int(input("Value to add: "))

# Find indices where value matches in array1 indices
= np.where(array1 == search_value)[0]

print(indices)

# Count occurrences in array1 count =
np.sum(array1 == count_value)
print(count)

# Broadcasting addition broadcasted = array1
+ broadcast_value
print(broadcasted) # Sort the first array
sorted_array = np.sort(array1)
print(sorted_array)
```

OUTPUT:

```
1 1 1 2 2 2
Value to search: 1
Value to count: 2
Value to add: 2
[0 1 2]
3
[3 3 3 4 4 4]
[1 1 1 2 2 2]
=== YOUR PROGRAM HAS ENDED ===
```

Terminal Test cases

Write a Python program that takes the file name of a CSV file containing student details, including roll numbers and their marks in three subjects as input, reads the data, and performs the following operations:

- **Print all student details:** Display the complete details of all students, including roll numbers and marks for all subjects.
- **Find total students:** Determine the total number of students in the dataset.
- **Print all student roll numbers:** Extract and print the roll numbers of all students.
- **Print Subject 1 marks:** Extract and print the marks of all students in Subject 1.
- **Find minimum marks in Subject 2:** Identify the lowest marks in Subject 2.
- **Find maximum marks in Subject 3:** Identify the highest marks in Subject

3.

- **Print all subject marks:** Display the marks of all students for each subject.
- **Find total marks of students:** Compute the total marks for each student across all subjects.
- **Find the average marks of each student:** Compute the average marks for each student.
- **Find average marks of each subject:** Compute the average marks for all students in each subject.
- **Find average marks of Subject 1 and Subject 2:** Compute the average marks for Subject 1 and Subject 2.
- **Find average marks of Subject 1 and Subject 3:** Compute the average marks for Subject 1 and Subject 3.
- **Find the roll number of the student with maximum marks in Subject 3:** Identify the student with the highest marks in Subject 3 and print their roll number.
- **Find the roll number of the student with minimum marks in Subject 2:** Identify the student with the lowest marks in Subject 2 and print their roll number.
- **Find the roll number of students who scored 24 marks in Subject 2:** Identify students who obtained exactly 24 marks in Subject 2 and print their roll numbers.
- **Find the count of students who got less than 40 marks in Subject 1:** Count the number of students who scored less than 40 marks in Subject 1.
- **Find the count of students who got more than 90 marks in Subject 2:** Count the number of students who scored more than 90 marks in Subject 2.
- **Find the count of students who scored ≥ 90 in each subject:** Count the number of students who scored 90 or more marks in each subject.
- **Find the count of subjects in which each student scored ≥ 90 :** Determine how many subjects each student scored 90 or more marks in.

- **Print Subject 1 marks in ascending order:** Sort and print the marks of students in Subject 1 in ascending order.
- **Print students who scored between 50 and 90 in Subject 1:** Display students who scored marks between 50 and 90 in Subject 1.
- **Find index positions of students who scored 79 in Subject 1:** Identify the index positions of students who scored exactly 79 marks in Subject 1.

CODE:

```
import numpy as np
```

```
a = np.loadtxt("Sample.csv", delimiter=',', skiprows=1)
```

```
# 1
```

```
print("All student Details:\n", a)
